BURNING FOSSIL FUELS & OLD TECHNOLOGY

FIGHTING ARCHAIC INFRASTRUCTURE

GreenRoots fights against the siting of new toxic facilities including those promoting archaic and hazardous energy infrastructure. Past victories include stopping a dirty diesel plant and flammable ethanol freight trains. Our current fight is against an electrical substation in a densely populated EJ neighborhood next to 8 million gallons of jetfuel.

PROMOTING RENEWABLE, RESILIENT ENERGY

GreenRoots is working to implement a community-owned microgrid, a unique model of resident-owned energy that is both renewable and resilient to climate threats. Our microgrid model supports a Just Transition towards renewable energy and away from polluting archaic infrastructure.

IMPLEMENTING GREATER ENERGY EFFICIENCY

Together with partners, we work to make energy efficiency programs easier for residents to access. We have successfully partnered to provide energy efficiency and addressed pre-weatherization barriers for over 150 homes while retrofitting small businesses and municipal buildings.
